

Proven **VEHICLE MOUNTED RFID**
and fleet management technologies provide
a **WINNING COMBINATION**
for on-board and proximity visibility.

VEHICLE MOUNTED RFID Solution

Automatically gain visibility of items and materials as vehicles travel the work flow. Ultra High Frequency (UHF) Radio Frequency Identification (RFID) requires no human engagement, scans hundreds of items at one time, and does not require the identification label to be visible.

Use vehicle mounted RFID to:

- + Track inventory on a delivery vehicle
- + Confirm tool count on a service vehicle
- + Verify items on a fire truck
- + Confirm equipment's presence in an ambulance
- + Determine which waste totes were accessed by a waste collection vehicle
- + And more

- RETAIL
- HEALTHCARE
- MANUFACTURING
- WAREHOUSING
- LOGISTICS

CAPTURE DATA ALONG THE VEHICLE'S ROUTE.

Though implementing RFID on a vehicle is not a new idea, CDO Technologies provides a unique perspective on gathered RFID data by combining it with fleet management data and making it visible within the vehicle information data stream. Before this revolutionary combination, collected RFID data was stored on the vehicle and communicated via Wi-Fi after the service run, or transmitted as a single piece of data via cellular. Users now have the ability to gather RFID data, associate it with other data elements, and communicate it in real-time.

Improve efficiency, drive quality, increase revenue and reduce costs with the data collected through visualizing assets with Vehicle Mounted RFID.

RFID tags placed on assets located inside or outside the vehicle scan automatically.
